

Table of Contents

This slide deck consists of slides used in 2 lecture videos in Week 4. Below is a list of shortcut hyperlinks for you to jump into specific sections.

- (page 2) [Week 4: jQuery and the Document Object Model](#)
- (page 11) [Week 4: Using jQuery](#)

jQuery and the DOM

- Dr. Charles Severance
- www.dj4e.com

<http://www.dj4e.com/code/jquery>
<http://www.dj4e.com/code/jquery.zip>

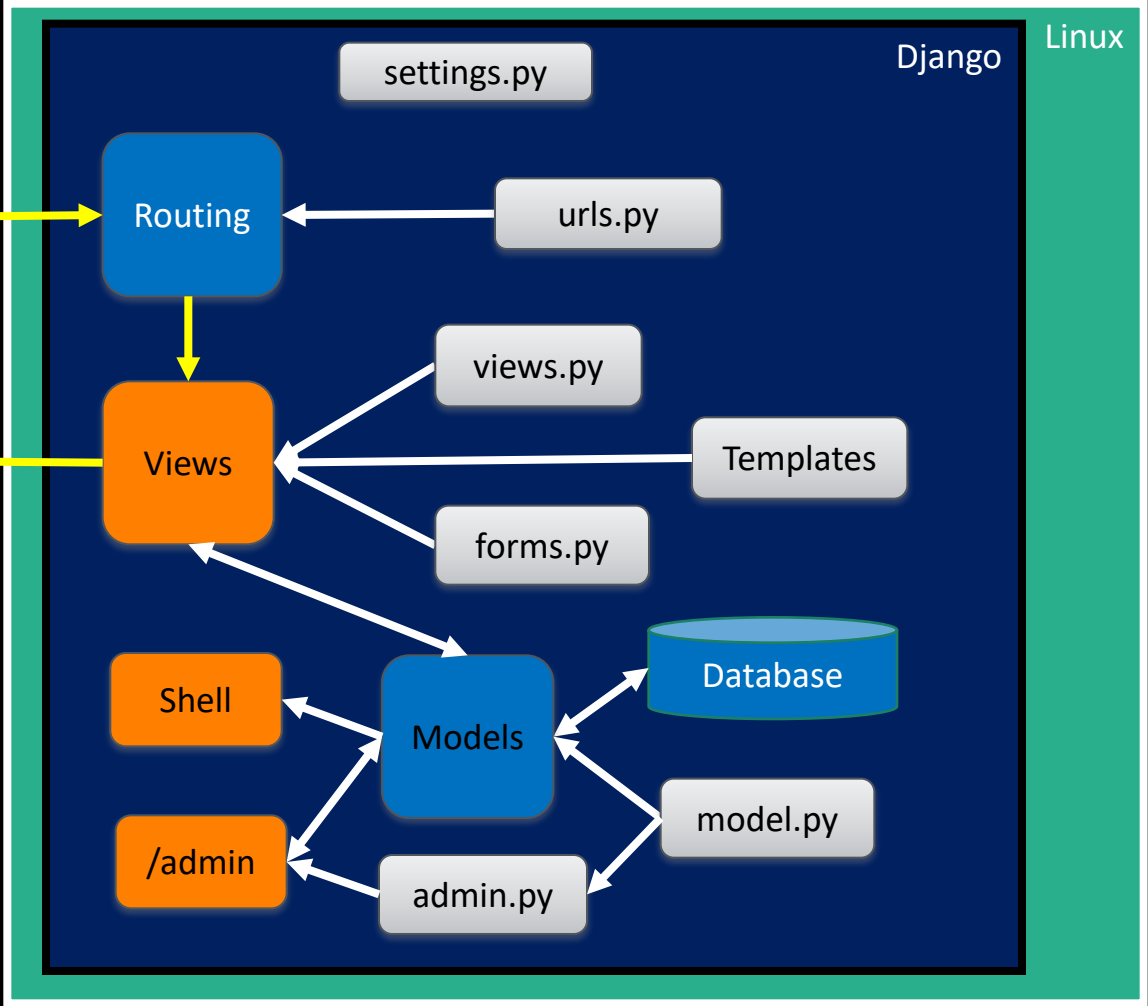

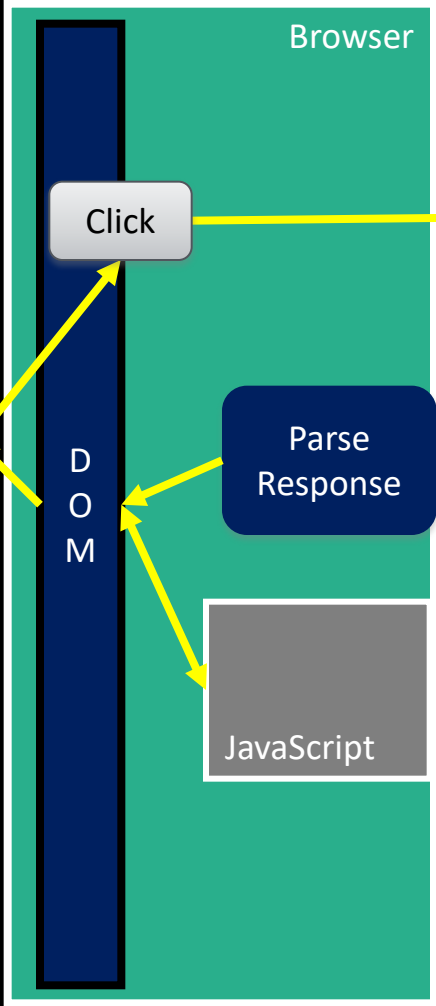

Vanilla JavaScript (1995)

```
<script type="text/javascript">  
  document.write("<p>Hello World</p>")  
</script>
```

<https://www.dj4e.com/code/javascript/js-01.htm>

http://en.wikipedia.org/wiki/Document_Object_Model

Document Object Model

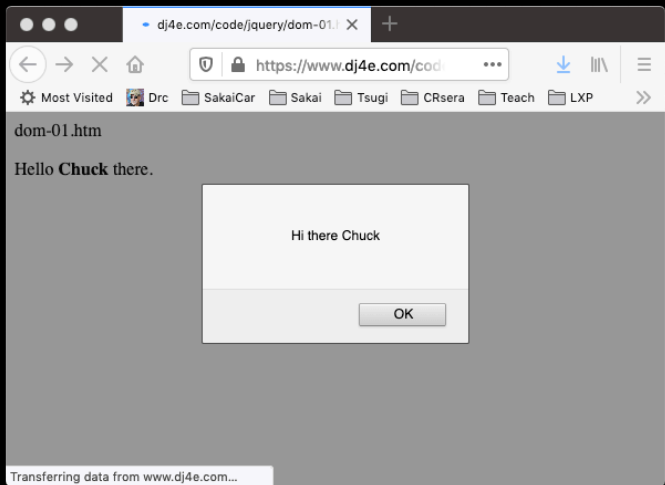

- JavaScript can manipulate the current HTML document.
- The “Document Object Model” is how we access various “bits” of the current screen to read and/or manipulate.
- We can even find pieces of the model by **id** attribute and change them.
- We can read and write the DOM from (Vanilla) JavaScript.

Using getElementById()

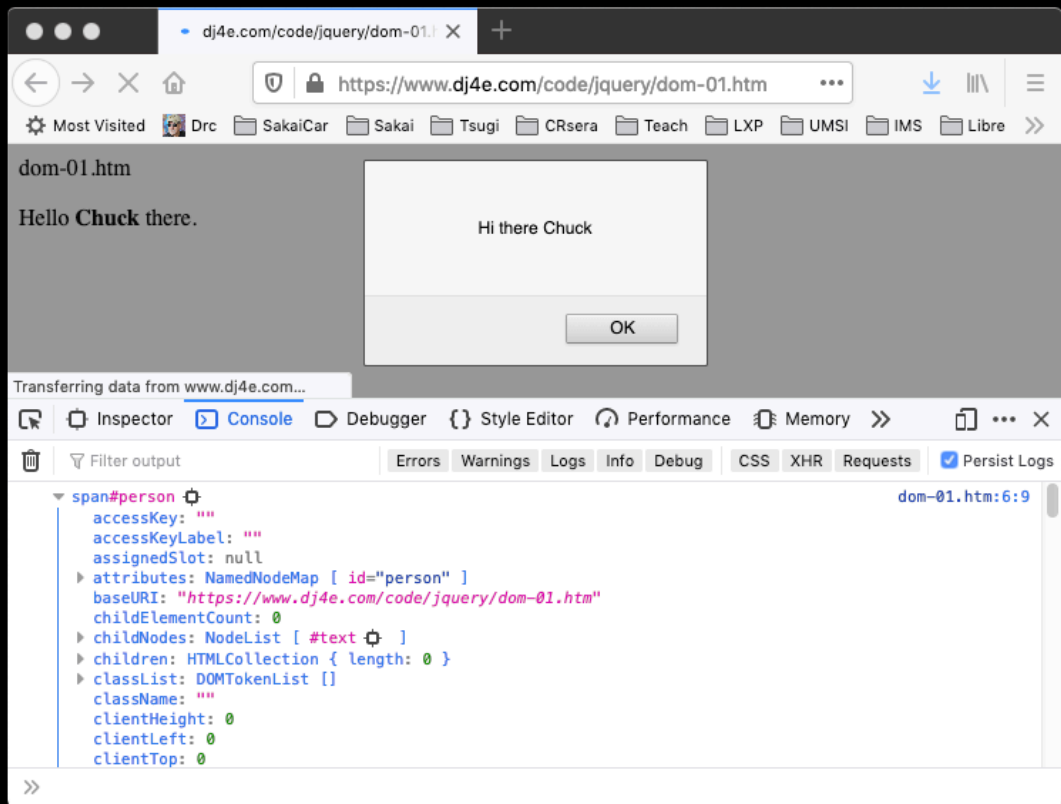

In order not to have to traverse each unique DOM, we use a function call that all browsers support. This allows us to bypass the DOM structure and jump to a particular tag within the DOM and manipulate that tag.

```
<p>
Hello <b><span id="person">Chuck</span></b> there.
</p>
<script type="text/javascript">
console.dir(document.getElementById('person'));
var st = document.getElementById('person').innerHTML;
console.log("ST = "+st);
alert('Hi there ' + st);
document.getElementById('person').innerHTML = 'Joseph';
</script>
```

dom-01.htm

dom-01.htm

```
console.dir(document.getElementById('person'));
```

```
<a href="#"
  onclick="document.getElementById('stuff').innerHTML='BACK';return false;">
  Back</a>
<a href="#"
  onclick="document.getElementById('stuff').innerHTML='FORTH';return false;">
  Forth</a>
</p>
<p>
Hello <b><span id="stuff">Stuff</span></b> there.
```

[Back Forth](#)

Hello **Stuff** there.

dom-02.htm

[Back Forth](#)

Hello **BACK** there.

[Back Forth](#)

Hello **FORTH** there.

Updating the Browser Document

This is one reason why you can only have one id per document.

```
<p>
<a href="#" onclick="add();return false;">More</a>
</p>
<ul id="the-list">
<li>First Item</li>
</ul>
<script>
counter = 1;
console.log(document.getElementById('the-list'))
function add() {
    var x = document.createElement('li');
    x.className = "list-item";
    x.innerHTML = "The counter is "+counter;
    document.getElementById('the-list').appendChild(x);
    counter++;
}
</script>
```

More

- First Item
- The counter is 1
- The counter is 2
- The counter is 3

jQuery (2005)

jQuery to the Rescue

- While the DOMs are not particularly portable, and direct DOM manipulation is a little clunky, there are a number of JavaScript frameworks that handle the myriad of subtle differences between browsers.
- With jQuery, instead of manipulating the DOM, we use jQuery functions and everything works much better...

<http://jquery.org>

John Resig

- Started jQuery in 2005 to make his web development projects easier
 - Elegant way to select DOM elements
 - Clean way to register events
- Released in 2006
- Works at Khan Academy as the “Dean of Computer Science”

jQuery Documentation

- The web is a wonderful source of jQuery documentation.
 - http://docs.jquery.com/Main_Page
 - <http://api.jquery.com/>
 - <http://jqueryui.com/demos/>
- This lecture will only cover the basic elements of low-level jQuery.

```
<html>
<head>
</head>
<body>
<p>Here is some awesome page content</p>
<script type="text/javascript" src="jquery.min.js">
</script>
<script type="text/javascript">
$(document).ready(function(){
    alert("Hello jQuery World!");
    console.log('Hello jQuery..');
});
</script>
</body>
```

jquery/jq-01.htm

```
<html
<head>
</head>
<body>
<script type="text/javascript" src="jquery.min.js">
</script>
<script type="text/javascript">
$(window).resize(function() {
    console.log('.resize() called. width='+
        $(window).width()+ ' height='+$(window).height());
});
</script>
<p>Here is some awesome page content</p>
</body>
```

```

<p id="para">Where is the spinner?
  
</p><p>
<a href="#" id="tog">Toggle</a> |
<a href="#" id="red">Red</a>
</p>
<script type="text/javascript">
$(document).ready(function() {
  $("#tog").on('click', function() {
    $('#spinner').toggle();
  });
  $("#red").on('click', function() {
    $('#para').css('background-color', 'green');
  });
});
</script>

```

jquery/jq-03.htm

Where is the
spinner?

[Toggle](#) | [Red](#)

Where is the
spinner?

[Toggle](#) | [Red](#)

Where is the
spinner?

[Toggle](#) | [Red](#)

```
<p>
<a href="#" id="the-href">More</a>
</p>
<ul id="the-list">
<li>First Item</li>
</ul>
<script type="text/javascript"
      src="jquery.min.js"> </script>
<script>
counter = 1;
$(document).ready(function() {
  $("#the-href").on('click', function() {
    console.log('Clicked');
    $('#the-list').append('<li>The counter is '+counter+'</li>');
    counter++;
  });
});
</script>
```

More

- First Item
- The counter is 1
- The counter is 2
- The counter is 3

Improving Browsers...

- jQuery is now > 15 years old – many people assume it *is* JavaScript
- The browsers have been extending the DOM in a portable fashion and adding features equivalent to jQuery

```
// jQuery: Hide all instances with class box  
$(".box").hide();
```

```
// Vanilla: Iterate over the nodelist of elements to hide all instances of .box  
document.querySelectorAll(".box").forEach(box => { box.style.display = "none" })
```

<https://tobiasahlin.com/blog/move-from-jquery-to-vanilla-javascript/>

Summary

- This focused on the mechanics of low-level jQuery.
 - Initialization setup
 - Event handling
 - DOM selection
 - DOM manipulation
- Vanilla JavaScript is catching up...
